

## leon-nanodrugs announces collaboration with Takeda

17 July 2018 | News

leon`s platform can be used from early compound screening to production of market batches. Positive results from this feasibility study could potentially result in a long-term collaboration between the companies, and additional compounds may also be considered.

leon-nanodrugs GmbH is pleased to announce that its proprietary MicroJet Reactor nano-technology has been selected by Takeda Pharmaceutical Company Ltd. (Takeda) for a feasibility assessment that could potentially lead to the development of an innovative formulation of one of their current pipeline products.

leon-nanodrugs announced that the company has started a feasibility assessment collaboration with Takeda. Under this collaboration, leon will support Takeda`s formulation efforts to optimize solubility, bioavailability and stability for one of Takeda`s current pipeline products for drug delivery using leon`s proprietary nanotechnology platform –MicroJet Reactor (MJR®).

leon`s platform can be used from early compound screening to production of market batches. Positive results from this feasibility study could potentially result in a long-term collaboration between the companies, and additional compounds may also be considered.

It is estimated that over 60% of pharmaceutical API's are poorly soluble in water. leon`s MJR technology offers reformulation options that not only address this issue, but can also lead to a superior profile for the API by increasing bioavailability, reducing inter patient variability, improving onset of action, etc. The one-step, bottom up, continuous precipitation process approach of the MJR technology is cost effective and easily scalable.

Dr. Michael Mehler, CEO of leon-nanodrugs GmbH comments,“We are very pleased and proud that Takeda selected our MJR technology for a feasibility assessment with one of their compounds in development. It is a major milestone for our company to win Takeda, a globally leading pharmaceutical company, as a partner and we look forward to this collaboration with the goal to contributing to bring valuable new medicines to patients worldwide.”
