

Sleep deprived Singaporeans may prone to serious health issues: Survey

14 March 2019 | Analysis

“It’s worrying that Singaporeans are still ranked among the world’s poorest sleepers, despite public awareness around the importance of quality sleep for overall health”

Singaporeans are among the world’s worst sleepers, getting just 6.3 hours of sleep on the weekdays and 6.7 on the weekend, lower than the global average of 6.8 and 7.8 hours respectively and the daily recommended 8 hours. This finding was among others announced by Royal Philips, a global leader in health technology, from its annual global sleep survey in a report, “*The Global Pursuit of Better Sleep Health*.”

The annual global sleep survey, carried out in conjunction with World Sleep Day (March 15), surveyed over 11,000 adults in Australia, Brazil, Canada, China, France, Germany, India, Japan, the Netherlands, Singapore, South Korea, and the United States to capture attitudes, perceptions, and behaviors around sleep.

Sleep becomes an elusive goal

Results showed that while awareness of sleep’s impact on overall health is on the rise, for many people across the globe, achieving good sleep health remains elusive. Besides being one of the top two nations having insufficient sleep, 70 percent of Singaporeans describe their sleep as ‘somewhat’ or ‘not at all’ well, and 4 in 10 (39 percent) say that their sleep has worsened in the past five years. The impact of this is demonstrated daily, with as many as 65 percent of Singaporeans saying they have experienced several episodes of daytime sleepiness throughout the week.

Stress was the main reason keeping Singaporeans up at night, with 61 percent of them losing sleep over worry or stress – higher than the 12-country average of 54 percent. Additionally, other factors that keep Singaporeans up at night include their sleeping environment (35 percent), distraction from entertainment such as television, social media (30 percent) and their partner’s snoring (14 percent) or sleep schedule (10 percent).

Facing such sleep deprivation, 81 percent of respondents from Singapore say that they want to improve their quality of sleep. To get a better sleep, Singaporeans are experimenting with a variety of methods, including instituting a set bedtime/wake-up schedule (28 percent), reducing their caffeine consumption (25 percent), playing soothing music (19 percent), and even sleeping in a different location from their partner (12 percent). Additionally, 11 percent of Singaporeans have also used

connected care devices to track their sleeping habits, according to Philips' Future Health Index (FHI) study.

"It's worrying that Singaporeans are still ranked among the world's poorest sleepers, despite public awareness around the importance of quality sleep for overall health," said Ivy Lai, Country Manager, Philips Singapore. "Philips is deeply rooted in its commitment to developing clinically-proven solutions that help people take control of their sleep health. Philips aims to provide solutions that meet the growing and evolving needs of consumers and healthcare professionals alike. To bridge the current gap in diagnosis and treatment of sleep disorders, last year we launched Southeast Asia's first Sleep and Respiratory Education Center in Singapore to upskill healthcare professionals across the region, aimed at enabling better access to sleep and respiratory care."

The quest for a better night's sleep

In seeking a better sleep, 43 percent say they would be willing to use online search engines to learn more about sleep and/or treatments to improve their sleep, 41 percent would be open to seeing a sleep specialist. Yet, despite the obvious need to address their lack of sleep, sleep issues are often deprioritized. Eighty percent of Singaporeans have not sought help from a medical professional, mainly due to the perceived high costs of sleep consultation (48 percent) and treatment (43 percent).

"Sleep is a key pillar of good overall health, as equally important as having a healthy diet and getting regular exercise. While most are aware that sleep is fundamentally important, achieving the recommended eight hours of quality sleep is still an elusive goal for many people each night," said Mark Aloia, PhD, Global Lead for Behavior Change, Sleep & Respiratory Care at Philips. "The lack of quality sleep may not only induce low productivity and daytime sleepiness, but also pose serious health issues if not addressed. Those who suffer from prolonged poor sleep should consult their doctor to identify contributing factors and determine if they or their partner are at risk of underlying health issues such as obstructive sleep apnea."

As a seldom-discussed, under-diagnosed condition, obstructive sleep apnea (OSA) is characterized by repeated interruptions in breathing throughout the sleep cycle and prevents oxygen from reaching the lungs. As many as 1 in 3 Singaporeans suffer from sleep apnea, and 91 percent have not been diagnosed.

Symptoms of OSA include choking or gasping for air during sleep, loud and persistent snoring and excessive daytime fatigue and poor concentration during the day. If left untreated, sleep apnea can have serious short and long-term health risks including heart disease, type 2 diabetes, stroke and high blood pressure.
