

Muno-Vax Biotechnologies launches Dentavax to combat gingivitis

25 March 2019 | News

Gingivitis, which is inflammation of the gums, can progress to more serious gum disease if left untreated

Dentavax, developed by Muno-Vax Biotechnologies, gives your oral mucosa's immune system a boost to minimize gingivitis, and help keep your gums and teeth healthy. All Muno-Vax supplements have a harmless antigen that boosts specific parts of the immune system in the body.

According to WebMD, research has shown a link between poor oral health and a growing number of other problems. Although no one knows how gum disease is linked to different health issues, some believe the oral bacteria enters the bloodstream and then attacks major organs.

Gingivitis, which is inflammation of the gums, can progress to more serious gum disease if left untreated. The best way to keep gingivitis at bay is to floss daily, brush at least twice a day, use mouthwash, eat a balanced diet and don't smoke.

Muno-Vax is introducing its immune-boosting supplements to the U.S. market in 2019. In addition to Dentavax, Muno-Vax is introducing its Respitim, which helps people ward off colds and the flu; Immuno De Oxy, which is for people with severely compromised immune systems; and Immuno-Uro Prostanorm, which promotes prostate health.

These nutritional supplements were developed by Bulgarian scientists with Natstim, Ltd., which is associated with the National Center of Infectious and Parasitic Diseases. The products are based on a well-known drug, Respivax, which was developed by the national center.
