

Crozet partners with PHV to develop Nipah virus vaccine

28 August 2019 | News

Crozet BioPharma announces \$10.8 Mn agreement to support development of single dose nipah Virus Vaccine through partnership with Public Health Vaccines

Crozet BioPharma has announced a \$10.8 million total value partnering agreement with Public Health Vaccines (PHV), to advance the development and manufacture of a vaccine against the Nipah virus, listed as a priority pathogen by the World Health Organization.

The Coalition for Epidemic Preparedness Innovations (CEPI) has granted PHV funding to support pre-clinical development, manufacturing, clinical advancement through Phase 2, and establishment of an investigational stockpile of the vaccine candidate worth up to \$43.6 million. PHV, a Cambridge-based biotechnology firm, has partnered with Crozet to provide core technical and strategic development services to the program.

Crozet, in collaboration with PHV, will engage its expert team of vaccine developers and manage a coalition of partners to develop the rVSV-Nipah vaccine. This includes design and oversight of critical technical elements of the development program including manufacturing and quality control of the vaccine, nonclinical safety and efficacy studies, tests for measuring immune responses, and Phase 1 and 2 clinical trials.

Dr. Thomas Monath, Managing Partner and Chief Scientific Officer at Crozet Biopharma said: "The Crozet team spent several years developing the successful rVSV-ZEBOV Ebola vaccine. That expertise will greatly facilitate advancement of the rVSV-Nipah vaccine. We look forward to our partnership with PHV, support from CEPI, and the opportunity to work with an extraordinary coalition of experts to develop a rVSV-Nipah vaccine candidate."

The vaccine candidate was developed by Dr. Heinz Feldmann within the Laboratory of Virology, Division of Intramural Research, National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health, and has been licensed to PHV by NIAID. The recombinant vesicular stomatitis virus (rVSV) vaccine candidate expressing a type of Nipah-virus protein (known as glycoprotein G) is designed to induce protection against the virus after a single dose.

Nipah virus, a bat-borne virus, can spread to humans and cause brain inflammation and pneumonia with a high mortality. Epidemics of the disease have emerged during the last 20 years in India, Southeast Asia and the western Pacific.

Dr. D. Gray Heppner, Crozet's Chief Medical Officer said: "Nipah virus infection causes a dreadful disease for which there is

no treatment. The Crozet team believes all people at risk of Nipah disease deserve the protection of a safe, effective vaccine."
