

## BI, Eli Lilly announce academic research collaboration

28 May 2020 | News

### On a pragmatic trial examining empagliflozin's effects following an acute myocardial infarction

Boehringer Ingelheim and Eli Lilly and Company have announced an academic research collaboration with the Duke Clinical Research Institute (DCRI) on a new trial, EMPACT-MI (EMPAgliflozin for the prevention of Chronic heart failure and morTality after an acute Myocardial Infarction).

The collaboration will investigate whether empagliflozin can improve outcomes and prevent heart failure in adults with and without diabetes who have had an acute myocardial infarction, more commonly known as a heart attack.

This randomized clinical trial will be conducted, analyzed and reported in partnership with the DCRI, with Boehringer Ingelheim and Lilly providing funding.

EMPACT-MI will include approximately 3,300 adults across at least 16 countries who have had an acute myocardial infarction. The primary endpoint of the trial is to assess the effect of empagliflozin on all-cause mortality and hospitalization for heart failure. The trial will be part of the EMPOWER program, the broadest and most comprehensive clinical trial program exploring the impact of empagliflozin on the lives of people with cardio-renal-metabolic conditions.
