

Medit releases patient communication applications

20 November 2020 | News

The new free applications focus on patient communication, providing visualizations of potential results to help the patient understand their options

South Korea based Medit has recently announced an update to its Medit Link software with the release of patient communication applications. The new free applications focus on patient communication, providing visualizations of potential results to help the patient understand their options and achieve their ideal smile.

Medit Ortho Simulation, Medit Crown Fit, Medit Smile Design, and Medit Compare expand the realm of what a scanner can do

The four applications are designed to aid patient understanding, covering a wide range of uses. Medit Ortho Simulation can demonstrate multiple potential tooth movement scenarios to help the patient visualize a future smile. Medit Crown Fit helps the clinician see possible pressure points enabling a modeless workflow reducing chair time and increasing patient comfort.

Medit Smile Design takes the patients future smile and places it in their image, so they can see what digital dentistry can do for them, while Medit Compare automatically aligns two sets of scan data, allowing for comparison.

Medit Link 2.3 makes scanning easier than ever

The new update allows the user to ignore selected colors, such as the color of one's gloves. Through the use of the scanner, the exact colors to be ignored can be chosen. This reduces the number of artifacts introduced by a clinicians' gloves during retraction, shortening the time needed to conduct a scan.
