Fresenius Medical Care opens first healthcare training centre in Korea

June 28, 2021 | News

Offering a wide range of programs and events to help deliver best possible care for chronically and critically ill patients

US-based Fresenius Medical Care, the world's leading provider of products and services for individuals with renal diseases, has recently announced the grand opening of its first training center in Korea, to offer comprehensive education programs and share its knowledge and experience in renal care, critical care, and treatment strategies with healthcare professionals.

The training programs and other events at the center will help strengthen the collective knowledge within the industry, unlocking the potential for improvement in patient care.

The Fresenius Medical Care Training Center, the first healthcare education facility in Korea to be run by a dialysis product provider, was established to support doctors, nurses, and clinical technicians in accessing the latest knowledge and skills within their professional practice.

The center offers a dedicated education hub for healthcare professionals to undertake training and upskilling programs in Yeouido, the city center of Seoul, providing an opportunity to have hands-on experience with Fresenius Medical Care's most advanced medical equipment used for hemodialysis (HD), automated peritoneal dialysis (APD) and continuous renal replacement therapy (CRRT).

Certified trainers from Fresenius Medical Care, together with regional clinical education experts from across Asia Pacific, will provide best practice training for healthcare professionals within the renal care field.
