

Fresenius Medical Care unveils intelligent home dialysis solutions in China

10 November 2021 | News

Dialysis patients in China to benefit from a new era in digitalized home dialysis

Fresenius Medical Care presented its advances in home dialysis solutions at the China International Import Expo (CIIE) in Shanghai. The company showcased new digitalized options that enable patients with end-stage kidney disease to perform dialysis in the comfort of their own homes, including the 5008S hemodialysis (HD) machine and a new automated peritoneal dialysis (APD) machine.

Importantly, these new technologies will be backed by Fresenius Medical Care's intelligent DiaSmart therapy data management system (TDMS+), which enables healthcare professionals to remotely monitor and manage patients throughout their home dialysis treatments.

Harry de Wit, CEO of Fresenius Medical Care Asia Pacific, said, "With these innovations, our hope is to provide patients in China with new options to dialyze safely in their own homes in ways that meet their individual needs and that can enhance their quality of life. Fresenius Medical Care will continue to commit to the ongoing development of pioneering medical technologies and introducing them to the renal care community and patients in China and across Asia Pacific."
