

Terumo and Glooko collaborate on new solution for diabetes data sharing

31 March 2022 | News

A technology integration for MEDISAFE WITH insulin patch pump patients to upload data anytime anywhere

Japan's Terumo Corporation and US-based Glooko have announced a technology integration to deliver new diabetes data sharing solutions together globally. This new integration will enable people with diabetes to transfer recorded data from MEDISAFE WITH™ insulin patch pump into the Glooko platform, thus helping them to visualize insulin dosage, food, and activities in graphs more easily and to realize personalized remote patient monitoring and patient care more effectively.

Available in Europe from May 2022, the two companies will start offering this new diabetes data solution, enabling patients to share their data with healthcare professionals easily both in the physicians' office and remotely from home. This integration will allow healthcare professionals to view the patient's latest health records more frequently, in-person at the clinic or remotely via Glooko's analytics portal.

Additionally, as a next step, both companies are working on a unique way of transferring recorded data from the MEDISAFE WITH™ insulin patch pump to the Glooko Mobile App directly via NFC (near field communication), which is planned to be launched in Europe later this year. MEDISAFE WITH™ will be the world's first insulin patch pump with direct NFC connection to the Glooko Mobile App, utilizing patients' personal smart phones to share their diabetes data with their diabetes team anytime, anywhere.
