

Pondok Indah hospital group achieves HIMSS EMRAM stage 6, the first in Indonesia

19 April 2022 | News

EMRAM is a system that measures digital maturity in a hospital

Pondok Indah Hospital Group (Rumah Sakit Pondok Indah Group) continues to carry out digital transformation through optimization, efficiency, and continuous integration efforts, consistent with the hospital group commitment to providing the best health services by prioritizing quality, security, safety, and comfort for patients. This digital transformation is also in line with the Indonesian government's efforts to encourage digitalization in the health industry, towards the 2024 Digital Health Transformation Strategy.

This continuous effort has led three hospitals within Pondok Indah Hospital Group to achieve Electronic Medical Record Adoption Model (EMRAM) Stage 6 by Healthcare Information and Management Systems Society (HIMSS) Analytics, the first in Indonesia.

To date, only 3 hospitals managed by Pondok Indah Hospital Group have successfully achieved EMRAM validation from HIMSS, in Indonesia. In Southeast Asia, a total of 7 hospitals have been actively validated EMRAM Stage 6 and 7 from HIMSS. Apart from Pondok Indah Hospital Group, two other hospitals are located in Singapore, and the other two are in Thailand.
