South Korean startup Vuno receives MFDS certification for electrocardiogram device

August 3, 2022 | News

Acquires Ministry of Food and Drug Safety Certification for 'Hativ Pro', a personal electrocardiogram measuring device

South Korea based VUNO, a global medical artificial intelligence solution company, has obtained the Ministry of Food and Drug Safety (MFDS) certification for its personal electrocardiogram measuring device 'Hativ Pro'. Starting with this certification, Vuno will expand its business area to B2C and start the bio-signal business based on ECG data in earnest.

'Hativ Pro' is the first hardware medical device introduced by VUNO. Since it is small and portable, it is possible to simply measure the heart signal anytime, anywhere. It is characterized by being able to check the measured signal at a glance through the connected mobile app.

Vuno, starting with this certification, will continue to release home artificial intelligent (AI) medical devices that can detect major heart diseases such as arrhythmias in the future. The company plans to continuously strengthen its medical AI business using electrocardiogram data, which has high potential as a clue to various cardiovascular diseases. Furthermore, it plans to launch 'Hativ', an integrated health management brand including home AI medical devices, to support consumers' daily health care and early diagnosis of chronic diseases.
