Chinese startup Chamlion secures ¥236 M to build new ecosystem of digital dentistry

19 April 2023 | News

Chamlion focuses on realising the digitalisation of the entire process of dentistry with a new generation of technology

China-based startup Chamlion has completed the B round fundraising of 236 million yuan (¥). This round of fundraising was led by 3H Health, followed by Vertex Ventures China, existing shareholder Zhencheng Capital, and Taihe Capital served as the financial advisor.

The fundraising will be mainly used for the further expansion of the company's domestic and overseas business, including the in-depth promotion and upgrade of their existing product line, to consolidate the company's leading position in the field of dental digitalisation.

In May 2021, the startup completed rebranding from "Chamlion Laser" to "Chamlion Technology", and at the same time started an in-depth business model transformation, changing from a traditional 3D printing equipment supplier to a cloud printing service model.

Chamlion applies the hardware as a service (HaaS) model in the field of dental 3D printing, intelligently connects 3D printers to the Internet, and builds a large-scale distributed dental manufacturing cloud factory, connecting the data-design-manufacturing process of dental processing, and building a digital service platform for the full process of dentistry.

Based in China and with a global layout, Chamlion has successively established branches in Vietnam, the United States, France, Turkey, built sales networks and companies covering many countries and regions around the world, and established localised and digital manufacturing centres. It is estimated that by the end of 2023, the number of global cloud factories will exceed 300, providing dental products to 30 million users around the world.
