

China Pharma Holdings to launch dry eye disease therapeutic device in Q1, 2025

19 August 2024 | News

A medical treatment device for dry eye disease under patent protection

China Pharma Holdings, Inc., an NYSE American-listed corporation with a fully-integrated specialty pharmaceuticals subsidiary based in China, has announced that through Hainan Helpson Medical and Biotechnology Co., a wholly owned subsidiary, it expects to launch its Dry Eye Disease Therapeutic Device in the first quarter (Q1) of 2025 in China.

It is a medical treatment device for dry eye disease under patent protection. The company, through Helpson, acquired the technology at the end of 2022 and has subsequently carried out the corresponding commercialisation, as well as the registration and application process of the product. It has completed production commissioning and third-party testing by now.

In China, the incidence of dry eye disease is about 21%-30%, second only to myopia. According to the National Bureau of Statistics of China, the total population of the country by the end of 2023 is about 1.4 billion, and the number of dry eye disease patients in China has approached 400 million.

Treatments for dry eye-related indications include two forms of secretagogues, oral and topical, which are widely recommended for first-line and second-line treatments. A major factor driving the segment's growth includes the awareness campaigns regarding dry eye diseases by vision science and optometry. This new device is embedded with an ophthalmic oxygen enriched atomisation therapeutic instrument.

Using such technology, the device can spray tiny oxygen-rich droplets evenly into patient's eyes, thereby increasing the moisture and oxygen supply of the eye surface and improving the quality and stability of the tear fluid. This type of physical therapy avoids the side effects that may be brought about by drugs, and can also effect more directly on the eyes, improving the effectiveness and comfort of the treatment.
