

## Australia starts world-first immunotherapy trial to treat Type 1 diabetes

30 April 2025 | News

**Type 1 diabetes affects more than 120,000 Australians and usually develops in children and young adults**

Researchers at The University of Queensland (UQ), Australia have dosed 5 participants in the first clinical trial of a potentially revolutionary immunotherapy drug to treat Type 1 diabetes.

Professor Ranjeny Thomas AM from UQ's Frazer Institute has led the development of a targeted immunotherapy drug, ASITI-201, which has been designed to rebalance the body's immune response to protect insulin-producing pancreatic cells.

"In people with Type 1 diabetes, the immune system starts to recognise pancreatic cells as something it needs to attack, and right now the only available treatment is insulin replacement," Professor Thomas said.

"We've taken a new approach and developed ASITI-201 using a protein from the pancreas, along with vitamin D to calm the immune response. This potential treatment uses the immune system's ability to heal and has been successful in controlling the disease in mice", Professor Thomas said.

Lead investigator Dr Aakansha Zala said the drug candidate aims to preserve as much pancreatic function for as long as possible in people recently diagnosed with Type 1 diabetes, to reduce the amount of insulin they need to administer.

"We are looking for people over the age of 18 who have been diagnosed with Type 1 diabetes within the last 5 years, to participate in the trial at the Translational Research Institute's Clinical Research Facility based at Brisbane's Princess Alexandra Hospital," Dr Zala said.

The trial itself is being funded by the Medical Research Future Fund via Australia's national biotech incubator CUREator which helped form spin-out company Liperate Therapeutics – which was established by UQ's commercialisation company UniQuest.

The drug's preclinical proof of concept was supported by multiple grants from Breakthrough T1D (formerly JDRF) totalling

\$2.54 million between 2003-2015.

The Leona M. and Harry B. Helmsley Charitable Trust subsequently awarded two grants totalling \$5.33 million to complete the preclinical development of the drug candidate, including safety studies and manufacturing.
