

China to buy Gamma Knife surgery worth \$25 mn

12 September 2013 | News | By BioSpectrum Bureau

Singapore: National Health and Family Planning Commission (NHFPC) of China is to purchase seven Leksell Gamma Knife Perfexion units at \$25 million. These units have been developed by Stockholm-based Elekta.

Gamma knife surgery is a non-invasive method for treating brain disorders. It is the delivery of a single, high dose of irradiation to a small and critically located intra-cranial volume through the intact skull.

Elekta was awarded the tender through a central procurement project organized by the NHFPC. Purchasing the Perfexion units is part of the Chinese government's continuous investment in healthcare.
