

"Indian manufacturers account for 60% of vaccine supplies made to UNICEF"

22 August 2017 | Opinion

'Indian vaccine manufacturers have several products in their R&D pipeline and as they roll out, the dominance of the multinational companies will subside in the coming years', says Dr Anand Kumar Managing Director Indian Immunologicals Ltd & Director Pristine Biologicals (NZ) Ltd, in an interaction with BioSpectrum Asia Magazine

Undoubtedly, India is the epicentre for vaccine manufacturing in the world. With many top vaccine giants supplying basic and advanced vaccines to nearly 150 countries, India, over the years, has emerged as the global vaccines hub. A report titled "Indian Vaccine Market Report and Forecast 2017-2022", says that the Indian vaccine market reached a value of around INR 59 Billion in 2016, growing at a CAGR of nearly 18% during 2009-2016. Indian vaccine industry with many state-of-the-art manufacturing facilities has earned India the recognition of having the largest global capacity for WHO prequalified vaccine manufacturing. Along with other factors, increased public awareness about vaccination and public immunization programs, coupled with government support to develop new vaccine act as key factors driving India's vaccine industry.

Speaking to BioSpectrum Asia Magazine, Dr K Anand Kumar, Managing Director Indian Immunologicals Ltd & Director Pristine Biologicals (NZ) Ltd, said that with many lucrative factors anchoring the vaccine business, the current market of USD 1 billion could easily double to USD 2 billion in less than 5 years.

With a robust R&D pipeline developing vaccines against Classical Fever, Goat pox and Infectious Bovine Rhinotracheitis (IBR)Indian Immunologicals Limited (IIL) is India's top vaccine manufacturing company which has presence both in Animal and Human vaccine markets.

IIL recently inked an MOU with INTA and Littoral Biologics of Argentina for transfer of technology for Bovine Parasitic vaccines in India. The deal will help IIL address this unmet need to control haemoprotozoan diseases transmitted by ticks in India and prevent loss of productivity in cattle.

In an interaction with Dr K Anand Kumar:

What according to you are upcoming trends in India's vaccine market?

The Indian vaccine market can be broadly be classified as the Domestic Trade Market (DTM) and Government Business

(GB) including UIP supplies. There is also an Export Market that the Indian manufacturers tap into supplying to UNICEF/GAVI by way of WHO PQ. The total market size for vaccines would be about a billion USD. Value wise the Export Market would be 50%, the trade market would be around 30% and the GB would be around 20%. There is growing awareness on preventive measures to fight against diseases in India. While Indian pharma industry is growing at 10% over the past year, the vaccine industry is growing at 25% between 2011- 2015. The upcoming trends in the market space include the following:

Increased uptake of new generation vaccines such as Pneumococcal conjugate vaccine, Varicella vaccine, Rotavirus vaccine, HPV, typhoid conjugate vaccine in the trade segment.

1. Increased uptake of multivalent vaccines such as the Hexavalent vaccine.
2. Large scale introduction of vaccines such as Pentavalent vaccine, inactivated polio vaccine, MR vaccine by the Government Business.
3. Ready to use presentation such as Prefilled syringes.
4. Needle free delivery.
5. Independent clinics for vaccination purposes only.
6. More and more focus on vaccines for Zoonotic diseases.
7. More and more recombinant vaccines will be seen in the animal vaccine segment.

Please elaborate on some on the key drivers of India's vaccine businesses?

There is more awareness now about the ability of vaccines to prevent disease than ever before. The Swach Bharat Mission also has helped bring in sense of good hygiene and cleanliness. It is inevitable that the government in the coming years will spend significant amount on Healthcare. Similarly the per capita government spend on routine immunization is also going to increase with the addition of vaccines such as Pneumococcal conjugate vaccine, inactivated polio vaccine etc. Several programmes including the India New born Action Plan launched in 2014 will increase the uptake of vaccines to prevent death below the age of 5. This will drive more volume.

The educated and growing middle class segment is vary of the benefits of vaccination and will ensure their children will get vaccinated to as many preventable diseases as possible.

The trade market is currently dominated by multinational companies (GSK, Pfizer, MSD) as many of the Indian manufacturers have only conventional vaccines in their product basket at the present moment. Indian manufacturers have several products in their R&D pipeline and as they roll out, the dominance of the multinational companies will subside in the coming years. With the introduction of vaccines by the Indian manufacturers, the market now will have a choice and pricing pressures will make it more affordable than what is being sold currently.

Indian manufacturers have the technical expertise to produce several vaccines at an affordable price. Indian manufacturers accounted for 60% of supplies made to UNICEF. Having tasted success several companies have expanded facilities to cater to the global markets to get a better price.

Where do you see the vaccine industry heading; five years from now?

The existing vaccine manufacturers will consolidate their position and with new product introductions will continue to dominate the domestic and UNICEF/GAVI markets. The current market of USD 1 billion could easily double to USD 2 billion in less than 5 years.

Several factors at the present moment may see new entrants in the form of big pharma houses enter into the vaccine business. Factors include a higher CAGR of the vaccine business than the pharma business, constant USFDA woes, NPPA and eroding margins, attractiveness of few players in the vaccine business etc. Given the huge capital costs and long lead times, this business is not for small time players and entrepreneurs.

Partnerships with vaccine companies abroad to access the Indian market will become common. In order to shorten regulatory time lines, companies may explore the possibility of importing the bulk of an approved product for fill/finish in India. Similarly Indian companies will also look at exporting bulk vaccines for fill finish in other markets.

Several new vaccines would be introduced by domestic players for several diseases such as Pneumonia, Varicella, Hepatitis A, IPV, Chikungunya etc.

In your opinion what are the most difficult challenges in vaccine business in India?

The challenges are:

Vaccine manufacturing involves huge capital investment upfront and subsequently the regulatory approval process for licensure i.e from conducting Pre Clinical Toxicology (PCT) studies to obtaining Marketing Authorization may take 5 years. Added to that if supplies are to be made to the government, some states require 3 year market standing. Based on the above cash flows will happen several years after investment is made.

- Vaccine manufacturing is a complex process that involves several upstream and down stream processing steps. Throughout manufacturing several in process control tests are employed. The final vaccine testing in some cases may take upto 3 months. All vaccines sold must be cleared by the Central Testing Lab in Kasauli and this further adds to the timeline. All this can add to inventory build up.
- Getting Industry ready candidates from educational institutions is a challenge. Most candidates have limited practical knowledge and the company has to spend almost a year in training them.
- Majority of the vaccines are for government sale and are procured based on tenders. If one fails to win a bid, the facilities and people will remain idle till the next tender.
- The nature of some diseases such as Swine fever, Flu are unpredictable. Anticipating demand at times would lead to excess inventory which may remain unconsumed.
- Getting quality epidemiological and surveillance data is also a challenge. Accurate incidence reporting and burden of disease estimates are all in infancy.

Many deadly diseases like Zika still do not have an approved vaccine. In your opinion what could be the reasons?

There are millions of microorganisms that exist in nature. Based on environmental conditions and genetic changes some of these organisms may exert higher levels of virulence at some period of time. It is economically unviable to develop vaccines in anticipation when the disease manifests at a low level and only in certain regions. I do not see any technical challenge in developing a vaccine for Zika, it's just that like any other vaccine candidate it has to go through a long journey to establish safety and efficacy credentials as a part of licensure.

- **Please talk about your product portfolio in depth.**

IIL as a one health company has presence both in Animal and Human vaccine markets.

Animal Vaccine Portfolio

IIL is the largest producer of animal vaccines in India. IIL operates one of the largest BSL 3 Plus facilities in the world for the manufacture of Foot and Mouth disease vaccine (FMD). IIL has introduced several other leading brands such as - Raksharab (Anti-Rabies Vaccine); Rakshavac-T (world's first vaccine against Theileriosis); Raksha-Blu (Blue Tongue vaccine); Megavac (Multi component canine vaccine); Bruvax (Brucellosis vaccine); Raksha -Triovac (Combination of trivalent FMD, HS and BQ); Raksha-Biovac (Combination of FMD and HS) and host of other bovine, canine and sheep vaccines. IIL also introduced the world's first vaccine against Porcine Cysticercosis - Cysvax. IIL is the only producer of companion animal vaccines in India.

In the R&D pipeline we are developing vaccines against Classical Fever, Goat pox and Infectious Bovine Rhinotracheitis (IBR)

Human Vaccine Portfolio

To a request from the Government of India to make a safe vaccine for Human Rabies IIL in 1999 launched the country's first purified Vero cell rabies vaccine (PVRV) - Abhayrab. Till date several million doses of the vaccine have been sold in India and over 29 countries and is a leading brand.

The success of Abhayrab emboldened IIL to embark on building a new vaccine facility in Hyderabad in the year 2006 to manufacture other human vaccines such as DPT Vaccine (Abhay TAG); DT Vaccine (Abhay-DAG); Recombinant Hepatitis-B Vaccine (Elovac-B); Tetanus Toxoid Vaccine (Abhay-Tox) and ERIG (Abhay-RIG).

IIL's Pentavalent vaccine has completed all the clinical trials and is expected to be licensed any moment. IIL's vaccines for hepatitis A, Chikungunya and Typhoid have successfully completed PCT and will move to the next stage i.e. human trials. IIL is also pursuing development of MR vaccine, Dengue vaccine and Pneumococcal vaccine. IIL's research team comprises scientists with interdisciplinary areas of expertise, who work on developing various vaccines using platform technologies such as recombinant strains for multiple antigen production, hybridoma for monoclonal antibodies, protein polysaccharide

conjugation and virus like particles through molecular biology.

Apart from vaccines, IIL markets several human and animal nutraceuticals, wellness products and formulations.

IIL has research collaborations with several reputed national and international institutes such as Centre for Disease Control and Prevention (CDC), USA; National Institute of Health (NIH), USA; Pirbright Institute, UK; Centre for Disease Control (CDC), Taiwan; US Army Medical Research Institute of Infectious Diseases, USA; GALVmed, UK; University of Melbourne, Australia; Indian Veterinary Research Institute (IVRI), India etc.
