LabConnect expands global central laboratory infrastructure with China facility

March 13, 2026 | News

To operate across regions with unified data, consistent operational oversight and advanced sample logistics

LabConnect, a leading provider of technology-driven central laboratory services and functional service provider solutions for clinical trials, has announced the grand opening of its new facility in Wuxi, China.

As clinical trials become increasingly global and complex, sponsors are seeking laboratory partners that can provide integrated testing, logistics and data oversight across regions. Together with LabConnect's laboratory capabilities in Australia, the new site strengthens the company's ability to support multi-regional clinical trials while helping Asia-Pacific pharmaceutical, biotechnology and clinical research organizations expand their research programs globally.

Fully integrated into LabConnect's global infrastructure, the Wuxi facility enables study teams to operate across regions with unified data, consistent operational oversight and advanced sample logistics and handling procedures.

The facility was developed in collaboration with Teddy Laboratory, now part of Frontage Laboratories, combining Teddy Laboratory's local laboratory expertise with LabConnect's global central laboratory services, logistics capabilities, and technology-driven decentralized network model.

The Wuxi facility will support a range of clinical trial services, including custom kit building, advanced sample tracking and logistics, and biorepository services, all designed to meet international regulatory standards.

With the addition of the Wuxi site, LabConnect now operates eight global locations, enabling sponsors and CROs to rely on a single partner for central laboratory services across studies of any size or geographic complexity.
