MurjÂ® expands global footprint with commercial launch in Australia and NZ

June 22, 2026 | News

Platform available to public hospital networks, private cardiology practices, and electrophysiology teams across both Australia and New Zealand

Murj®, a US-based cardiac device management software company, has announced its official expansion into the Australian market alongside broader availability for New Zealand (NZ).

Following its exhibition at the recent CSANZ / HRS Advances in Pacing and Conduction System Pacing Summit in Melbourne, the company has established active commercial operations and sales channels across the region.

The expansion introduces Murj to regional health systems and cardiology practices, supporting cardiac implantable electronic device (CIED) remote and in-clinic device management, ambulatory cardiac monitoring, and heart failure programmes.

The Murj CIED platform is in use by more than 1,000 cardiac device clinics in the USA, who cumulatively manage more than 900,000 active CIED patients.

Murj brings multi-manufacturer device data, clinical context, workflow management, automated EHR data flows, and deep analytics in a unified and efficient operating model. By streamlining device workflows the platform helps reduce administrative burden and provides longitudinal visibility across the patient journey. This enables cardiac care teams to confidently focus on the patient rather than the process.

Adoption of Murj comes as regional cardiovascular programs transition away from legacy, on-premises tools toward modern, cloud-native workflows. The Murj platform is available to public hospital networks, private cardiology practices, and electrophysiology teams across both Australia and New Zealand with all the advantages of cloud-based and pain-free feature expansion.
